5. ÅRG. NR. 8

December 1980

Møde i selskabet

Mandag d. 15. december kl. 19³⁰ præcis i auditorium
IX på H.C. Ørstedsinstitutet

holder

Richard Gill
Mathematical Centre & Free University Amsterdam

et foredrag over emnet

IS FACTOR ANALYSIS STATISTICS?.

In the first half of the talk I want to survey the identifiability problems surrounding the model of factor analysis, pointing out the serious consequences for the interpretation of factor analysis results.

This indicates that the power of factor analysis as a tool for exploratory data analysis will also be poor. Therefore I hope in the second half of the talk to go on to discuss some recently developed alternative methods (due to deLeeuw and his coworkers at the University of Leiden) and to sketch the relationships between these methods and the methods of principal components and correspondence analysis.

Efter mødet vil der være en lille sammenkomst med et let traktement efter de sædvanlige retningslinier.
